

Help Clean Up the Ocean with BakkerElkhuizen Circular Ergonomic Products

Why Circular?

The plastic soup is a widely recognised and major problem. Bakker Elkhuizen believe it is their duty to make a contribution and to tackle the plastic problem together. They do this by using as little plastic as possible and by recycling PET bottles and making new products from them.

Approximately 94% of all the plastic that ends up in the water ends up on the seabed. If we continue like this, our oceans will have more plastic than fish in 2050, predicted by the Ellen McArthur Foundation.

How do BakkerElkhuizen make a Difference?

By following the '3Rs' Reduce waste, Reuse products and Recycle material; Bakker Elkhuizen can begin to reduce their environmental footprint.

Good for the Planet, Better for the Budget

The recommended retail price of circular products is exactly the same as the comparable products in our acrylic line.

Contains up to 100% Recycled Material

Depending on the colour, about 60% of the material used in circular products comes from recycled material. However, the newly made product is 100% recyclable, even the screws.

Soft, but Still Strong

Although the material appears to be soft, no compromises have been made for the required properties such as load-bearing capacity. These products are also very strong, just like acrylic.
